# 11 REVISION EXAMINATION (NUMERICAL PROBLEMS) – FEBRUARY 2023

## PART – III PHYSICS

Time Allowed : 3.00 Hours ]

[ Maximum Marks : 70

- Instructions :**
- (1) Check the question paper for fairness of printing. If there is any lack of fairness, inform the Hall Supervisor immediately.
  - (2) Use **Blue** or **Black** ink to write and underline and pencil to draw diagrams.

## PART – II

Note : Answer **All the** questions.

14x2=28

1. A car takes a turn with the velocity  $50 \text{ ms}^{-1}$  on a circular road of radius of curvature 10 m. Calculate the centrifugal force experienced by a person of mass 60 kg inside the car. **[MARCH – 2019]**
2. The surface tension of a soap solution is  $0.03 \text{ Nm}^{-1}$ . How much work is done in producing soap bubble of radius 0.05 m? **[MARCH – 2019]**
3. Calculate the value of orbital velocity for an artificial satellite of earth orbiting at a height of 1000 km (Mass of the earth =  $6 \times 10^{24} \text{ kg}$ , radius of the earth = 6400 km). **[MARCH – 2019]**
4. During a cyclic process, a heat engine absorbs 500 J of heat from a hot reservoir, does work and ejects an amount of heat 300 J into the surroundings (cold reservoir). Calculate the efficiency of the heat engine. **[MARCH – 2020, AUGUST - 2022]**
5. If the length of the simple pendulum is increased by 44% from its original length, calculate the percentage increase in time period of the pendulum. **[MARCH – 2020]**
6. The position vector and angular velocity vector of a particle executing uniform circular motion at an instant are  $2\hat{i}$  and  $4\hat{k}$  respectively. Find its linear velocity at that instant. **[SEPTEMBER – 2020]**
7. A metal cube of side 0.20 m is subjected to a shearing force of 4000 N. The top surface is displaced through 0.50 cm with respect to the bottom. Calculate the shear modulus of elasticity of the metal. **[SEPTEMBER – 2020]**

[ Turn Over

11105

2

8. Two objects of masses 2 kg and 4 kg are moving with same momentum of  $20 \text{ kgms}^{-1}$ .
- (A) Will they have same kinetic energy?
- (B) Will they have same speed? **[SEPTEMBER - 2020]**
9. In a submarine equipped with sonar, the time delay between the generation of a pulse and its echo after reflection from an enemy submarine is observed to be 80 sec. If the speed of sound in water is  $1460 \text{ ms}^{-1}$ , what is the distance of enemy submarine? **[MAY - 2022]**
10. A particle moves along the x-axis in such a way that its coordinates x varies with time 't' according to equation  $x=2-5t+6t^2$ . What is the initial velocity of the particle?  
**[MAY - 2022]**
11. A mobile phone tower transmits a wave signal of frequency 900 MHz. Calculate the length of the waves transmitted from the mobile phone tower. **[AUGUST - 2022]**
12. Consider two trains A and B moving along parallel tracks with same velocity in the same direction. Let the velocity of each train be 50 km / hr due east. Calculate the relative velocities of the trains. **[AUGUST - 2022]**
13. If two objects of masses 2.5 kg and 100 kg experience the same force 5 N, what is the acceleration experienced by each of them?
14. Consider a circular leveled road of radius 10 m having coefficient of static friction 0.81. Three cars (A, B and C) are travelling with speed  $7 \text{ m s}^{-1}$ ,  $8 \text{ m s}^{-1}$  and  $10 \text{ ms}^{-1}$  respectively. Which car will skid when it moves in the circular level road?  
( $g = 10 \text{ m s}^{-2}$ )

## PART - III

Note : Answer **All the** questions.

14x3=42

15. What is the torque of the force  $\vec{F} = 3\hat{i} - 2\hat{j} + 4\hat{k}$  acting at a point  $\vec{r} = 2\hat{i} + 3\hat{j} + 5\hat{k}$  about the origin? **[MARCH - 2019]**
16. Find the rotational kinetic energy of a ring of mass 9 kg and radius 3m rotating with 240 rpm about an axis passing through its centre and perpendicular to its plane. **[MARCH - 2019]**
17. Two waves of wavelength 99 cm and 100 cm both travelling with the velocity of  $396 \text{ ms}^{-1}$  are made to interfere. Calculate the number of beats produced by them per sec. **[MARCH - 2019]**
18. A ball is thrown vertically upwards with the speed of  $19.6 \text{ ms}^{-1}$  from the top of a building and reaches the earth in 6 s. Find the height of the building. **[MARCH - 2019]**
19. An object is thrown with initial speed  $5 \text{ ms}^{-1}$  with an angle of projection  $30^\circ$ . Calculate the maximum height reached and the horizontal range. **[MARCH - 2020]**
20. A force of  $(4\hat{i} - 3\hat{j} + 5\hat{k})$  N is applied at a point whose position vector is  $(7\hat{i} + 4\hat{j} - 2\hat{k})$  m. Find the torque of force about the origin. **[MARCH - 2020]**
21. From a point on the ground, the top of a tree is seen to have an angle of elevation  $60^\circ$ . The distance between the tree and a point is 50 m. Calculate the height of the tree. **[MARCH - 2020]**
22. A train was moving at the rate of  $54 \text{ kmh}^{-1}$  when brakes were applied. It came to rest within a distance of 225 m. Calculate the retardation produced in the train. **[SEPTEMBER - 2020]**
23. Suppose we go 200 km above and below the surface of the Earth, what are the g values at these two points? In which case, is the value of g small? **[SEPTEMBER - 2020]**
24. Calculate the amplitude, angular frequency, frequency, time period and initial phase of the simple harmonic oscillation for the given equation  $y = 0.3 \sin (40\pi t + 1.1)$ . **[SEPTEMBER - 2020]**

[ Turn Over

**11105**

25. Express 76 cm of mercury pressure in terms of  $\text{Nm}^{-2}$  using the method of dimensions. **[SEPTEMBER - 2020]**
26. What are the resultants of the vector product of two vectors given by  $\vec{A} = 4\hat{i} - 2\hat{j} + \hat{k}$  and  $\vec{B} = 5\hat{i} + 3\hat{j} - 4\hat{k}$ ? **[MAY - 2022]**
27. A person does 30 kJ work on 2 kg of water by stirring using a paddle wheel. While stirring, around 5 kcal of heat is released from water through its container to the surface and surroundings by thermal conduction and radiation. What is the change in internal energy of the system? **[MAY - 2022]**
28. An electron of mass  $9.1 \times 10^{-31}$  kg revolves around a nucleus in a circular orbit of radius  $0.53\text{\AA}$ . What is the angular momentum of the electron? (Velocity of electron  $v=2.2 \times 10^6 \text{ms}^{-1}$ ) **[AUGUST - 2022]**

## REVISION EXAMINATION (NUMERICAL PROBLEMS) – FEBRUARY 2023

## ANSWER KEY

## PART - II

Note : Answer All the questions.

14x2=28

1. Centrifugal force is given by,  $F_{cf} = \frac{mv^2}{r}$  ;  $= \frac{60 \times 50 \times 50}{10}$  ;  $= 6 \times 2500$

$F_{cf} = 15000 \text{ N}$

2. Work done = total surface area x surface tension

$W = 2 \times 4\pi r^2 \times T$  ;  $= 2 \times 4 \times 3.14 \times (0.05)^2 \times 0.03$

$= 0.0025 \times 0.03 \times 8 \times 3.14$

$= 1.884 \times 10^{-3} \text{ J}$

3.  $V = \sqrt{\frac{GM_e}{R_e+h}}$  ;  $= \sqrt{\frac{6.67 \times 10^{-11} \times 6 \times 10^{24}}{(6400+1000) \times 10^3}}$   $V = 7.353 \text{ kms}^{-1}$

4. The efficiency of heat engine is given by  $\eta = 1 - \frac{Q_L}{Q_H}$  ;  $\eta = 1 - \frac{300}{500}$  ;  $= 1 - \frac{3}{5}$  ;

$\eta = 1 - 0.6$  ;  $0.4$

The heat engine has 40% efficiency, implying that this heat engine converts only 40% of the input heat into work.

5.  $T \propto \sqrt{l}$  ;  $T = \text{constant} \sqrt{l}$

$\frac{T_f}{T_i} = \sqrt{\frac{1+\frac{44}{100}l}{l}}$  ;  $\sqrt{1.44} = 1.2$  ;

Therefore,  $T_f = 1.2 T_i = T_i + 20\% T_i$

6.  $\vec{L} = \vec{r} \times \vec{\omega}$  ;  $= 2\vec{i} \times 4\vec{k}$  ;  $8\vec{j}$

7.  $L = 0.20\text{m}$ ,  $F=4000\text{N}$ ,  $x=0.50\text{cm}$  ;  $=0.005\text{m}$  and Area  $A = L^2 = 0.04 \text{ m}^2$

Therefore,  $\eta_R = \left(\frac{F}{A}\right) \times \left(\frac{L}{x}\right)$  ;  $= \left(\frac{4000}{0.04}\right) \times \left(\frac{0.20}{0.005}\right)$  ;  $= 4 \times 10^6 \text{ Nm}^{-2}$

8. (a) The kinetic energy of the mass is given by  $KE = \frac{p^2}{2m}$

For the object of mass 2kg, kinetic energy is  $KE_1 = \frac{(20)^2}{2 \times 2} = \frac{400}{4} = 100\text{J}$

For the object of mass 4kg, kinetic energy is  $KE_2 = \frac{(20)^2}{2 \times 4} = \frac{400}{8} = 50\text{J}$

the kinetic energy of **both masses is not the same**. The kinetic energy of the **heavier object has lesser kinetic energy than smaller mass**.

(b) As the momentum,  $p = mv$ , the two objects **will not have same speed**.

9.  $v = 80\text{s}$  ,  $v = 1460\text{ ms}^{-1}$ ,  $D = ?$

$$D = \frac{v t}{2} = \frac{1460 \times 80}{2} ; = 1460 \times 40 ; 58400\text{m}$$

$$D = 58.4\text{km}$$

10.  $X = 2 - 5t + 6t^2$

$$\text{Velocity } v = \frac{dx}{dt} = \frac{d}{dt}(2 - 5t + 6t^2) \text{ or } v = -5 + 12t$$

$$\text{For initial velocity, } t = 0. \text{ Initial velocity} = -5\text{ ms}^{-1}$$

11. Frequency,  $f = 900\text{ MHz}$ ;  $= 900 \times 10^6\text{ Hz}$

$$\text{The speed of wave is } c = 3 \times 10^8\text{ms}^{-1}$$

$$\lambda = \frac{v}{f} = \frac{3 \times 10^8}{900 \times 10^6} ; = 0.33\text{m}$$

12. Relative velocity of B with respect to A,  $v_{BA} = v_B - v_A$

$$= 50\text{ km h}^{-1} + (-50)\text{ km h}^{-1} ; = 0\text{ km h}^{-1}$$

Similarly, relative velocity of A with respect to B i.e.,  $v_{AB}$  is also zero.

Thus each train will appear to be at rest with respect to the other.

13. For the object of mass 2.5 kg, the acceleration is  $a = \frac{F}{m} = \frac{5}{2.5} ; = 2\text{ms}^{-2}$

$$\text{For the object of mass } 100\text{ kg, the acceleration is } a = \frac{F}{m} = \frac{5}{100} ; = 0.05\text{ms}^{-2}$$

14. From the safe turn condition, the speed of the vehicle ( $v$ ) must be less than or equal

$$\sqrt{\mu_s r g} ; v \leq \sqrt{\mu_s r g} ; \sqrt{\mu_s r g} = \sqrt{0.81 \times 10 \times 10} = 9\text{ ms}^{-1}$$

For car C,  $\sqrt{\mu_s r g}$  is less than  $v$

The speed of car A, B and C are  $7\text{ ms}^{-1}$ ,  $8\text{ ms}^{-1}$  and  $10\text{ ms}^{-1}$  respectively. The cars A and B will have safe turns. But the car C has speed  $10\text{ ms}^{-1}$  while it turns which exceeds the safe turning speed. Hence, the car C will skid.

## PART - III

Note : Answer All the questions.

14x3=42

$$15. \quad \vec{\tau} = \vec{r} \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 2 & 3 & 5 \\ 3 & -2 & 4 \end{vmatrix}$$

$$= (12 - (-10))\hat{i} + (15 - 8)\hat{j} + (-4 - 9)\hat{k} ; \vec{\tau} = 22\hat{i} + 7\hat{j} - 13\hat{k}$$

16. The rotational kinetic energy is ,  $KE = \frac{1}{2} I \omega^2$ .

The moment of Inertia of the ring is,  $I = MR^2$

$$I = 9 \times 3^2 ; = 9 \times 9 ; = 81 \text{ kgm}^2$$

The angular speed of the ring is,  $\omega = 240 \text{ rpm} ; = \frac{240 \times 2\pi}{60} \text{ rads}^{-1}$

$$KE = \frac{1}{2} \times 81 \times \left(\frac{240 \times 2\pi}{60}\right)^2 ; = \frac{1}{2} \times 81 \times (8\pi)^2 ;$$

$$KE = \frac{1}{2} \times 81 \times 64 (\pi)^2 ;$$

$$= 2592 \times (\pi)^2 ; KE \approx 25920 \text{ J}$$

$$KE = 25.920 \text{ kJ} \quad [(\pi)^2 \approx 10]$$

17. Frequency of first wave  $f_1 = \frac{v}{\lambda_1} = \frac{396}{0.96}$  ; Frequency of second wave  $f_2 = \frac{v}{\lambda_2} = \frac{396}{1}$

Thus number of beat produced per second  $b = f_1 - f_2 ; = 396 \left[ \frac{1}{0.99} - \frac{1}{1} \right] ; b = 4$

18. The ball is thrown upwards with velocity 19.6 m/s. During the upward motion it experiences  $-9.8 \text{ m/s}^2$  acceleration due to which it comes to rest momentarily at the highest point in air. We can calculate the time taken to reach the highest point.

$$v = u + at ; 0 = 19.6 - 9.8 t ; t = 2 \text{ sec}$$

So the ball reaches the topmost point in air in 2 seconds.

Distance travelled by the ball until it reaches the highest point:

$$s = ut + at^2/2 = 19.6 \times 2 + 9.8 \times 2^2/2 \quad s = 19.6 \times 2 + 19.6 = 19.6 \times 3 = 58.8 \text{ m}$$

Hence the ball travels 58.8 m above the height of tower after throwing. Now the ball comes down and experiences an acceleration of  $+9.8 \text{ m/s}^2$ .

The time in which it reaches down from the highest point is 4 sec (6-2) because 2 sec is consumed in reaching the highest point.

Now let us calculate the distance travelled by the ball to reach the earth in 4 sec.  
 $s = ut + at^2/2 \quad s = 0 \times t + 9.8 \times 4^2/2 \quad s = 9.8 \times 8 \text{ m}$  This distance also includes the distance from the throwing point to the highest point, ie 58.8m.

So we need to subtract that distance from this calculated distance of  $9.8 \times 8 \text{ m}$ .

So height of tower =  $9.8 \times 8 - 58.8 = 9.8 \times 8 - 9.8 \times 3 = 9.8 \times 5 = 49 \text{ m}$ . Hence height of the tower is 49 m.

19. i) maximum height of the projectile,  $h_{\max} = \frac{u^2 \sin^2 \theta}{2g}$   
 $h_{\max} = \frac{5^2 \sin 30^\circ \sin 30^\circ}{2 \times 9.8}$ ;  $= \frac{25 \times \left[\frac{1}{2}\right] \times \left[\frac{1}{2}\right]}{2 \times 9.8}$ ;  $= \frac{25}{8 \times 9.8}$ ;  $= \frac{25}{78.4}$ ;  $h_{\max} = 0.3188\text{m}$

ii) Horizontal Range  $R = \frac{u^2 \sin 2\theta}{g}$ ;  $= \frac{u^2 2 \sin \theta \cos \theta}{g}$ ;  $= \frac{5^2 \times 2 \sin 30^\circ \cos 30^\circ}{9.8}$   
 $= \frac{25 \times 2 \left[\frac{1}{2}\right] \times \left[\frac{\sqrt{3}}{2}\right]}{9.8}$ ;  $= \frac{25 \times 1.732}{2 \times 9.8} = \frac{43.300}{19.6}$ ;  $R = 2.21\text{m}$

20.  $\vec{\tau} = \vec{r} \times \vec{F} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 7 & 4 & -2 \\ 4 & -3 & 5 \end{vmatrix}$   
 $= (20 - 6)\hat{i} - (35 + 8)\hat{j} + (-21 - 16)\hat{k}$  ;  
 $= (14\hat{i} - 43\hat{j} - 37\hat{k}) \text{ Nm}$

21. For triangulation method  $\tan \theta = \frac{h}{x}$   
 $h = x \tan \theta$ ;  $= 50 \times \tan 60^\circ$ ;  $= 50 \times 1.732$   
 $h = 86.6 \text{ m}$ ; **The height of the tree is 86.6 m.**

22. The final velocity of the particle  $v = 0$   
 The initial velocity of the particle  $u = 54 \times \frac{5}{18} \text{ ms}^{-1} = 15 \text{ ms}^{-1}$  ;  $s = 225 \text{ m}$   
**Retardation is always against the velocity of the particle.**  
 $v^2 = u^2 - 2aS$ ;  $0 = (15)^2 - 2a(225)$ ;  $450 a = 225$   
 $a = \frac{225}{450} \text{ ms}^{-2}$  ;  $= 0.5 \text{ ms}^{-2}$  ; **Retardation = 0.5 ms<sup>-2</sup>**

23.  $g' = g \left(1 - \frac{d}{R_E}\right)$ ;  $= \left(1 - \frac{200 \times 10^3}{6371 \times 10^3}\right)$ ;  $= g(1 - 0.0314)$ ;  $= g(0.9686)$   
 $g' = 0.96 g$   
 Variation of  $g'$  with altitude  
 $g' = g \left(1 - \frac{2h}{R_E}\right)$ ;  $= \left(1 - \frac{2 \times 200 \times 10^3}{6371 \times 10^3}\right)$ ;  $= g(1 - 2(0.0314))$ ;  $= g(0.9372)$   
 $g' = 0.94 g$

24.  $y = A \sin(\omega t + \varphi_0)$   
 Amplitude  $A = 0.3$  unit  
 Angular frequency  $\omega = 40\pi$  rad  $s^{-1}$   
 Frequency  $f = \frac{\omega}{2\pi} ; = \frac{40\pi}{2\pi}$   $f = 20$  Hz  
 Time period  $T = \frac{1}{f} ; = \frac{1}{20}$   $T = 0.05$  sec.  
 Initial phase  $\varphi_0 : 1 : 1$  rad
25. In cgs system 76 cm of mercury pressure =  $76 \times 13.6 \times 980$  dyne  $cm^{-2}$   
 The dimensional formula of pressure P is  $[ML^{-1}T^{-2}]$
- $$P_1 [M_1^a L_1^b T_1^c] = P_2 [M_2^a L_2^b T_2^c] ; P_2 = P_1 \left[ \frac{M_1}{M_2} \right]^a \left[ \frac{L_1}{L_2} \right]^b \left[ \frac{T_1}{T_2} \right]^c$$
- $M_1 = 1g, M_2 = 1kg; L_1 = 1$  cm,  $L_2 = 1m; T_1 = 1$  s,  $T_2 = 1s$   
 As  $a = 1, b = -1,$  and  $c = -2$
- Then  $P_2 = 76 \times 13.6 \times 980 \left[ \frac{1kg}{1kg} \right]^1 \left[ \frac{1cm}{1m} \right]^{-1} \left[ \frac{1s}{1s} \right]^{-2}$   
 $= 76 \times 13.6 \times 980 \left[ \frac{10^{-3}kg}{1kg} \right]^1 \left[ \frac{10^{-2}m}{1m} \right]^{-1} \left[ \frac{1s}{1s} \right]^{-2}$   
 $= 76 \times 13.6 \times 980 \times [10^{-3}] \times 10^2$   
 $P_2 = 1.01 \times 10^5$   $Nm^{-2}$
26.  $\vec{A} \times \vec{B} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 4 & -2 & 1 \\ 5 & 3 & -4 \end{vmatrix}$   
 $= (8 - 3)\hat{i} + (5+16)\hat{j} + (12 + 10)\hat{k} ;$   
 $\vec{A} \times \vec{B} = 5\hat{i} + 21\hat{j} + 22\hat{k}$
27. Work done on the system (by the person while stirring),  $W = -30$  kJ =  $-30,000$ J  
 Heat flowing out of the system,  $Q = -5$  kcal =  $-5 \times 4184$  J =  $-20920$  J  
 Using First law of thermodynamics,  $\Delta U = Q - W$   
 $\Delta U = -20,920$  J -  $(-30,000)$  J  
 $\Delta U = -20,920$  J +  $30,000$  J =  $9080$  J  
 Here, the heat lost is less than the work done on the system, so the change in internal energy is positive.
28. Angular momentum of electron  $L = mvr$   
 $9.1 \times 10^{-31} \times 2.2 \times 10^6 \times 0.53 \times 10^{-10}$   
 $10.61 \times 10^{-35}$   $kgms^{-2}$
