As equation (5) is identical with equation (6), we can equate the coefficients of

$$-3V_c V^2 = - \left[ \frac{RT_c}{P_c} + b \right] V^2$$

$$3V_c = \frac{RT_c}{P_c} + b \quad \text{---- (7)}$$

$$3V_c^2 = \frac{a}{P_c} \quad \text{---- (8)}$$

$$V_c^3 = \frac{ab}{P_c} \quad \text{---- (9)}$$

$V^2$ ,  $V$  and constant terms in (5) and (6).

Divide equation (9) by equation (8)

$$\frac{V_c^3}{3V_c^2} = \frac{ab/P_c}{a/P_c} \quad \frac{V_c}{3} = b$$

$$\text{i.e. } V_c = 3b \quad \text{----- (10)}$$

when equation (10) is substituted in (8)

$$3V_c^2 = \frac{a}{P_c}$$

$$P_c = \frac{a}{3V_c^2} = \frac{a}{3(3b)^2} = \frac{a}{3 \times 9b^2} = \frac{a}{27b^2}$$

$$P_c = \frac{a}{27b^2} \quad \text{----- (11)}$$

substituting the values of  $V_c$  and  $P_c$  in equation (7),

$$3V_c = b + \frac{RT_c}{P_c} \quad 3(3b) = b + \frac{RT_c}{\left( \frac{a}{27b^2} \right)}$$

$$9b - b = \left( \frac{RT_c}{a} \right) 27b^2 \quad 8b = \frac{T_c R 27b^2}{a}$$

$$\therefore T_c = \frac{8ab}{27Rb^2} = \frac{8a}{27Rb} \quad \text{----- (12)}$$

The critical constants can be calculated using the values of van der waals constant of a gas and vice versa.

$$a = 3V_c^2 P_c \quad \text{and} \quad b = \frac{V_c}{3}$$
