

St. Paul's Mat. Hr. Sec. School, Block - 4, Neyveli, Cuddalore District
Common Quarterly Examination – 2023
Computer Science Answer Key

I. Choose the best Answer						
1	d) Parameters	1				
2	a) Pair	1				
3	d) Name Spaces	1				
4	d) Half – interval search	1				
5	d) Big O	1				
6	d) Ctrl + N	1				
7	a) Ternary	1				
8	C) else if	1				
9	a) for	1				
10	b) $x \% 4 == 0$	1				
11	b) return	1				
12	b) []	1				
13	a) { }	1				
14	b) . dot	1				
15	d) {1, 3, 6, 9}	1				
Part - II						
II. Answer the following (Any six) Q. No 24 is Compulsory						
16	<table border="1" style="width: 100%;"> <thead> <tr> <th style="width: 50%; text-align: center;">Constructors</th> <th style="width: 50%; text-align: center;">Selectors</th> </tr> </thead> <tbody> <tr> <td>Constructors are functions that build the abstract data type.</td> <td>Selectors are functions that retrieve information from the data type.</td> </tr> </tbody> </table>	Constructors	Selectors	Constructors are functions that build the abstract data type.	Selectors are functions that retrieve information from the data type.	2
Constructors	Selectors					
Constructors are functions that build the abstract data type.	Selectors are functions that retrieve information from the data type.					
17	Mapping <ul style="list-style-type: none"> ➤ The process of binding a variable name with an object is called mapping. ➤ = (equal to sign) is used in programming languages to map the variable and object. 	2				
18	Algorithm <ul style="list-style-type: none"> ➤ An algorithm is a finite set of instructions to accomplish a particular task. ➤ It is a step-by-step procedure for solving a given problem 	2				
19	Tokens <ul style="list-style-type: none"> ➤ Python breaks each logical line into a sequence of elementary lexical components known as Tokens. ➤ The normal token types are , <ol style="list-style-type: none"> 1) Identifiers, 2) Keywords, 3) Operators, 4) Delimiters and 5) Literals. 	2				
20	Anonymous Function <ul style="list-style-type: none"> ➤ In Python, anonymous function is a function that is defined without a name. ➤ While normal functions are defined using the def keyword, in Python anonymous functions are defined using the lambda keyword. ➤ Hence, anonymous functions are also called as lambda functions. 	2				
21	Main advantages of functions <ul style="list-style-type: none"> ➤ It avoids repetition and makes high degree of code reusing. ➤ It provides better modularity for your application. 	2				
22	Sets <ul style="list-style-type: none"> ➤ In python a set is another type of collection data type ➤ A set is a mutable and an unordered collection of elements without or repeated element ➤ This feature used to include membership testing and eliminating duplicate element 	2				
23	Create constructor in Python <ul style="list-style-type: none"> ➤ “init” is a special function begin and end with double underscore in Python act as a Constructor. ➤ Constructor function will automatically executed when an object of a class is created. ➤ General format: <code>def __init__(self, [args]):</code> <code><statements></code> 	2				
24	Welcome Welcome Welcome Welcome	2				

III. Answer the following (Any six) Q.No 33 is Compulsory																													
25	<p>Characteristics of Interface</p> <ul style="list-style-type: none"> ➤ The class template specifies the interfaces to enable an object to be created and operated properly. ➤ An object's attributes and behaviour is controlled by sending functions to the object. 	3																											
26	<p>Asymptotic Notation:</p> <ul style="list-style-type: none"> ➤ Asymptotic Notations are languages that use meaningful statements about time and space complexity. ➤ The following three asymptotic notations are mostly used to represent time complexity of algorithms <p>(i) Big O Big O is often used to describe the worst-case of an algorithm.</p> <p>(ii) Big Ω Big Omega is the reverse Big O.</p> <p>(iii) Big Θ When an algorithm has a complexity with lower bound = upper bound,</p>	3																											
27	<p>Global scope:</p> <ul style="list-style-type: none"> ➤ A variable which is declared outside of all the functions in a program is known as global variable. ➤ Global variable can be accessed inside or outside of all the functions in a program. <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>1. a:=10</td> <td>Entire program</td> <td>Output of the Program</td> </tr> <tr> <td>2. Disp():</td> <td>a := 10:</td> <td>7</td> </tr> <tr> <td>3. a:=7</td> <td>Disp():</td> <td>10</td> </tr> <tr> <td>4. print a</td> <td>a:=7</td> <td></td> </tr> <tr> <td>5. Disp()</td> <td>print a</td> <td></td> </tr> <tr> <td>6. print a</td> <td>Disp():</td> <td></td> </tr> <tr> <td></td> <td>print a</td> <td></td> </tr> </table>	1. a:=10	Entire program	Output of the Program	2. Disp() :	a := 10:	7	3. a:=7	Disp():	10	4. print a	a:=7		5. Disp()	print a		6. print a	Disp():			print a		3						
1. a:=10	Entire program	Output of the Program

34 a)	<table border="1" style="width: 100%;"> <thead> <tr> <th style="text-align: left;">Parameter with type</th> <th style="text-align: left;">Parameter without type</th> </tr> </thead> <tbody> <tr> <td> <pre>let rec pow (a:int) (b:int) : int := if b=0 then 1 else a * pow a (b-1)</pre> <ul style="list-style-type: none"> ➤ The parameters 'a' and 'b' are specified in the data type brackets () in the above function definition. ➤ This is an example of parameters with type. </td> <td> <pre>let rec pow a b:= if b=0 then 1 else a * pow a (b-1)</pre> <ul style="list-style-type: none"> ➤ In the above function definition, the variables 'a' and 'b' are parameters and the value which is passed to the variables 'a' and 'b' are arguments. ➤ We have also not specified the data type for 'a' and 'b'. ➤ This is an example of parameters without type </td> </tr> </tbody> </table>	Parameter with type	Parameter without type	<pre>let rec pow (a:int) (b:int) : int := if b=0 then 1 else a * pow a (b-1)</pre> <ul style="list-style-type: none"> ➤ The parameters 'a' and 'b' are specified in the data type brackets () in the above function definition. ➤ This is an example of parameters with type. 	<pre>let rec pow a b:= if b=0 then 1 else a * pow a (b-1)</pre> <ul style="list-style-type: none"> ➤ In the above function definition, the variables 'a' and 'b' are parameters and the value which is passed to the variables 'a' and 'b' are arguments. ➤ We have also not specified the data type for 'a' and 'b'. ➤ This is an example of parameters without type 	5
Parameter with type	Parameter without type					
<pre>let rec pow (a:int) (b:int) : int := if b=0 then 1 else a * pow a (b-1)</pre> <ul style="list-style-type: none"> ➤ The parameters 'a' and 'b' are specified in the data type brackets () in the above function definition. ➤ This is an example of parameters with type. 	<pre>let rec pow a b:= if b=0 then 1 else a * pow a (b-1)</pre> <ul style="list-style-type: none"> ➤ In the above function definition, the variables 'a' and 'b' are parameters and the value which is passed to the variables 'a' and 'b' are arguments. ➤ We have also not specified the data type for 'a' and 'b'. ➤ This is an example of parameters without type 					
34 b)	<p>Characteristics of Modules</p> <p>The following are the desirable characteristics of a module.</p> <ol style="list-style-type: none"> 1. Modules contain instructions, processing logic, and data. 2. Modules can be separately compiled and stored in a library. 3. Modules can be included in a program. 4. Module segments can be used by invoking a name and some parameters. 5. Module segments can be used by other modules. 					

35 a)

Bubble sort algorithm

5

Bubble sort is a simple sorting algorithm, it starts at the beginning of the list of values stored in an array.

- It compares each pair of adjacent elements and swaps them if they are in the unsorted order.
- This comparison and passed to be continued until no swaps are needed, which shows the value sin an array is sorted.
- It is named so because, the smaller elements "bubble" to the top of the list.
- It is too slow and less efficient when compared to other sorting methods.

Pseudo code

1. Start with the first element i.e., index = 0, compare the current element with the next element of the array.
2. If the current element is greater than the next element of the array, swap them.
3. If the current element is less than the next or right side of the element, move to the next element.
4. Go to Step 1 and repeat until end of the index is reached.

Example:

Consider an array with values {15, 11, 16, 12, 14, 13}

Below, we have a pictorial representation of how bubble sort.

The above pictorial example is for iteration-1.

- Similarly, remaining iteration can be done.
- The final iteration will give the sorted array.
- At the end of all the iterations we will get the sorted values in an array as given below:

11	12	13	14	15	16
----	----	----	----	----	----

35 b)

SCRIPT MODE PROGRAMMING:

- A script is a text file containing the Python statements.
- Once the Python Scripts is created, they are reusable , it can be executed again and again withoutre typing.
- The Scripts are editable

(i)Creating Scripts in Python1.

- Choose **File** → **New File** or press **Ctrl + N** in Python shell window.
- An **untitled** blank script text editor will be displayed on screen.

(ii)Saving Python Script

- Choose **File** → **Save** or Press **Ctrl + S**
- Now, **Save As** dialog box appears on the screen.
- In the **Save As** dialog box
- Select the location to save your Python code.
- Type the file name in **File Name** box.
- Python files are by default saved with extension **.py**.
- So, while creating scripts using Python Script editor, no need to specify the file extension.
- Finally, click **Save** button to save your Python script.

(iii)Executing Python Script

- Choose **Run** → **Run Module** or Press **F5**
- If your code has any error, it will be shown in red color in the IDLE window, and Python describes the type of error occurred.
- To correct the errors, go back to Script editor, make corrections, save the file and execute it again.

36 a)	<p>Nested if..elif...else statement:</p> <ul style="list-style-type: none"> ➤ When we need to construct a chain of if statement(s) then elif clause can be used instead of else ➤ Elif clause combines if..else-if..else statements to one if..elif...else. ➤ elif can be considered to be abbreviation of else if. ➤ In an if statement there is no limit of „elif“ clause that can be used, but an else clause if used should be placed at the end. ➤ Syntax: if <condition-1>: statements-block 1 elif <condition-2>: statements-block 2 else: statements-block n <p>Example : Any one valid Example</p>	5																								
36 b)	<p>Explain the following built in functions</p> <table border="1"> <thead> <tr> <th data-bbox="204 757 384 792">Function</th> <th data-bbox="384 757 756 792">Description</th> <th data-bbox="756 757 932 792">Syntax</th> <th data-bbox="932 757 1382 792">Example</th> </tr> </thead> <tbody> <tr> <td data-bbox="204 792 384 936">id ()</td> <td data-bbox="384 792 756 936">Return the “identity” of an object. i.e. the address of the object in memory</td> <td data-bbox="756 792 932 936">type (object)</td> <td data-bbox="932 792 1382 936">x=15 print ('address of x is :',id (x)) Output: address of x is : 1357486752</td> </tr> <tr> <td data-bbox="204 936 384 1070">chr ()</td> <td data-bbox="384 936 756 1070">Returns the Unicode character for the given ASCII value.
