	<p>The smallest value of Z is 9. Since the feasible region is unbounded, we draw the graph of $3x + 2y < 9$. The resulting open half plane has points common with feasible region, therefore $Z = 9$ is not the minimum value of Z. Hence the optimal solution does not exist.</p>				1

$$a = \frac{\sum Y}{n} = \frac{532}{7} = 76, \quad b = \frac{\sum XY}{\sum X^2} = \frac{672}{28} = 24$$

$$Y_c = a + bX, \quad Y_c = 76 + 24X$$

Estimated sales = Y_c for 2023 = $76 + 24 \times 6 = ₹220$ lacs

Define Null hypothesis H_0 and alternate hypothesis H_1 as follows:
 $H_0: \mu = 0.50 \text{ mm}$
 $H_1: \mu \neq 0.50 \text{ mm}$

1

	<p>Thus a two-tailed test is applied under hypothesis H_0, we have</p> $t = \frac{\bar{X} - \mu}{s} \sqrt{n - 1} = \frac{0.53 - 0.50}{0.03} \times 3 = 3$ <p>Since the calculated value of $t = 3$ does not lie in the interval $-t_{0.025}$ to $t_{0.025}$ i.e., -2.262 to 2.262 for $10 - 1 = 9$ degree of freedom So we Reject H_0 at 0.05 level. Hence we conclude that machine is not working properly.</p>	1
