

TN CLASS 12

Magnetism & magnetic effects Of current

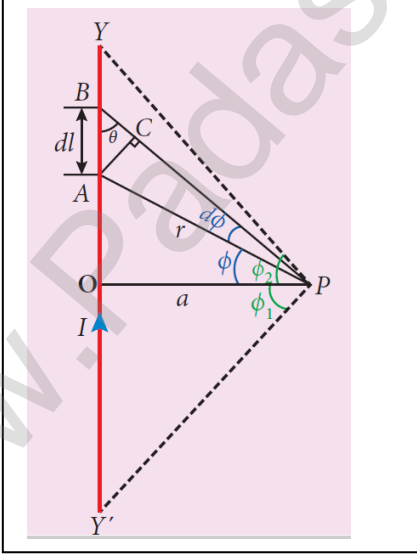

Formulae sheet!

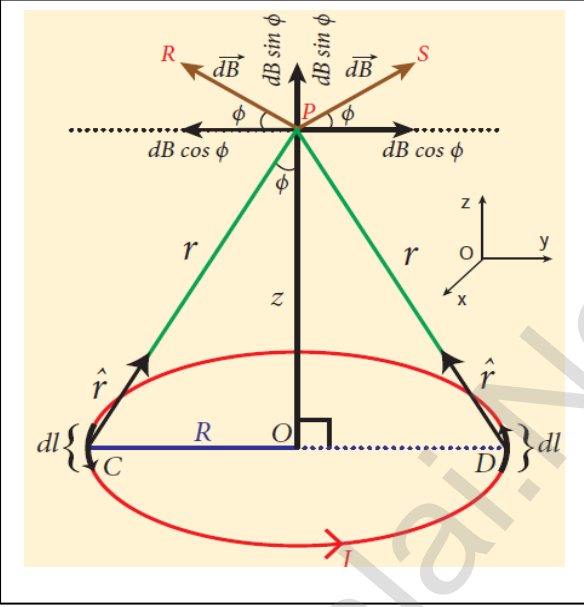

PRIT-EDUCATION

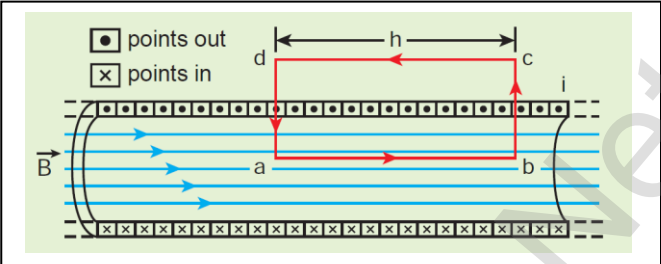

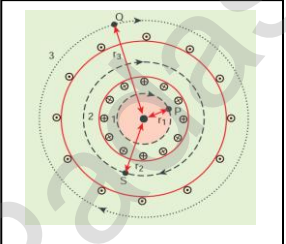

SS. PRITHVI

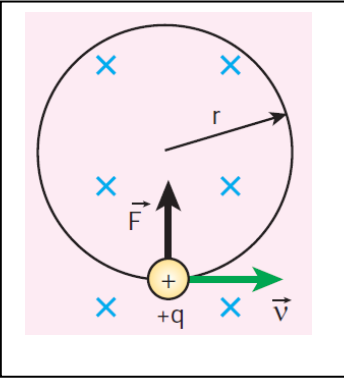

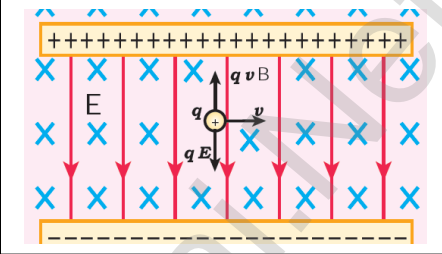

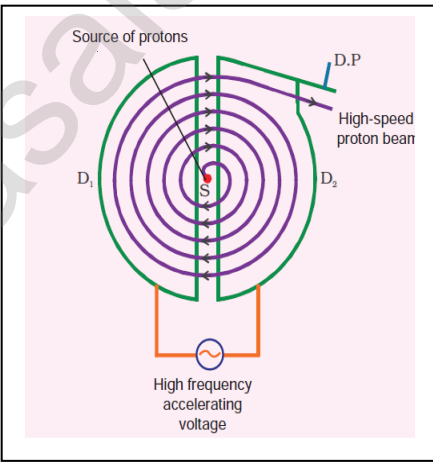

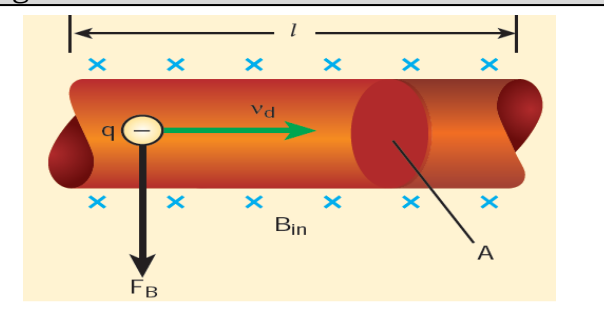

FORMULAE	EXPLANATION OF THE TERMS INVOLVED	SI UNIT
<p><b>HORIZONTAL COMPONENT</b> -Earth's magnetic field</p> $B_H = B_E \cos I$	<p><math>B_E</math> = net Earth's magnetic field at any point on the surface of the Earth  <math>B_H</math> = horizontal component of Earth's magnetic field</p> <p><b>At magnetic equator</b> <math>B_H = B_E</math>  <b>At magnetic poles</b> <math>B_H = 0</math></p>	<p>Magnetic field  <math>B = \text{Tesla (T)}</math></p> <p>CGS unit:  <b>GAUSS</b>  1 GAUSS= <math>10^{-4}</math> TESLA</p>
<p><b>VERTICAL COMPONENT</b> - Earth's magnetic field</p> $B_V = B_E \sin I$	<p><math>B_E</math> = net Earth's magnetic field at any point on the surface of the Earth  <math>B_H</math> = vertical component of Earth's magnetic field</p> <p><b>At magnetic equator</b> <math>B_V = 0</math>  <b>At magnetic poles</b> <math>B_V = B_E</math></p>	
<p><b>ANGLE OF DIP</b></p> $\tan I = \frac{B_H}{B_V}$	<p><math>B_H</math>=Horizontal component of magnetic field  <math>B_V</math>=Vertical component of magnetic field  tan I =angle of dip</p>	<p>Magnetic field  <math>B = \text{Tesla (T)}</math>  1 GAUSS=<math>10^{-4}</math> TESLA</p>
<p><b>MAGNETIC DIPOLE MOMENT</b></p> $\vec{p}_m = q_m \vec{d}$	<p><math>p_m</math>= magnetic dipole moment  <math>q_m</math>= pole strength of the magnetic pole  <math>d</math>= distance between south pole to north pole = <math>2l</math></p>	<p>Ampere per metre square  <math>\text{Am}^2</math></p>
<p><b>MAGNETIC FIELD</b></p> $\vec{B} = \frac{1}{q_m} \vec{F}$	<p><math>B</math>=magnetic field  <math>q_m</math>=pole strength  <math>F</math>= force experienced by the bar magnet</p>	<p><math>\text{NA}^{-1}\text{m}^{-1}</math></p>
<p><b>RATIO OF MAGNETIC LENGTH AND GEOMETRICAL LENGTH</b></p> $\frac{\text{Magnetic length}}{\text{Geometrical length}} = \frac{5}{6} = 0.833$	$\frac{\text{Magnetic length}}{\text{Geometrical length}} = \frac{5}{6} = 0.833$	<p>no unit</p>
<p><b>MAGNETIC FLUX</b>  I) FOR UNIFORM FIELD</p> $\Phi_B = \vec{B} \cdot \vec{A} = BA \cos \theta = B_{\perp} A$ <ul style="list-style-type: none"> <li>SCALAR QUANTITY</li> <li><math>\text{M L}^2\text{T}^{-2}\text{A}^{-1}</math></li> </ul>	<p><math>\phi_B</math>= magnetic flux  <math>B</math>=magnetic field  <math>A</math>=area vector ; <math>\theta</math> = angle between <math>\rho B</math> and <math>A</math></p> <p>II) FOR NON UNIFORM FIELD</p> $\Phi_B = \int \vec{B} \cdot d\vec{A}$	<p>SI:weber (Wb)  CGS:Maxwell</p> <p>1 weber = <math>10^8</math> maxwell</p>
<p><b>MAGNETIC FLUX DENSITY</b></p> $\frac{\text{No of magnetic field lines}}{\text{Unit Area}}$	<p><b>The magnetic flux density is defined as the number of magnetic field lines crossing per unit area kept normal to the direction of lines of force.</b></p>	<p><math>\text{Wb m}^{-2}</math> or tesla (T)</p>

<p><b>COULOMB'S INVERSE SQUARE LAW OF MAGNETISM</b></p> $F = k \frac{q_{m_A} q_{m_B}}{r^2}$	<p>F= force between two magnetic poles r = distance between two magnetic poles</p> $k = \frac{\mu_0}{4\pi} \approx 10^{-7} \text{ H m}^{-1}$ <p>; <math>\mu_0</math>= absolute permeability of free space ; <math>q_m</math>=pole strength</p>	<p>force: newton (N) k: Henry per metre <math>\text{Hm}^{-1}</math></p>
<p><b>MAGNETIC FIELD AT A POINT ALONG THE AXIAL LINE OF THE MAGNETIC DIPOLE (BAR MAGNET)</b></p> $\vec{B}_{axial} = \frac{\mu_0}{4\pi} \frac{2}{r^3} \vec{p}_m$	<p><math>P_m</math>= magnetic dipole moment r=distance from the centre of the magnet to the point C. B=magnetic field</p>	<p>Magnetic field B = Tesla (T)</p>
<p><b>MAGNETIC FIELD AT A POINT ALONG THE EQUATORIAL LINE DUE TO A MAGNETIC DIPOLE (BAR MAGNET)</b></p> $\vec{B}_{equatorial} = -\frac{\mu_0}{4\pi} \frac{\vec{p}_m}{r^3}$	<p><math>P_m</math>= magnetic dipole moment r=distance from the centre of the magnet to the point C. B=magnetic field</p>	<p>Magnetic field B = Tesla (T)</p>
<p><b>TORQUE ON A BAR MAGNET IN UNIFORM MAGNETIC FIELD</b></p> $\tau = p_m B \sin \theta$	<p><math>P_m</math>= magnetic dipole moment B=magnetic field</p>	<p>torque: newton metre <math>\text{Nm}</math></p>
<p><b>POTENTIAL ENERGY IN BAR MAGNET</b></p> $U = -\vec{p}_m \cdot \vec{B}$	<p>U=potential energy <math>P_m</math>= magnetic dipole moment B=magnetic field</p>	<p>Joule (J)</p>
<p><b>MAGNETISING FIELD</b></p>	<p><math>\vec{H}</math> = magnetising field</p>	<p><math>\text{Am}^{-1}</math></p>
<p><b>INTENSITY OF MAGNETIZATION</b></p> $\vec{M} = \frac{\text{Magnetic moment}}{\text{Volume}} = \frac{\vec{p}_m}{V}$	<p>M= intensity of magnetization <math>P_m</math>= magnetic dipole moment v=volume</p>	<p><math>\text{Am}^{-1}</math></p>
<p><b>MAGNETIC INDUCTION OR TOTAL MAGNETIC FIELD</b></p> $\vec{B} = \vec{B}_o + \vec{B}_m = \mu_0 \vec{H} + \mu_0 \vec{M}$ $\vec{B} = \vec{B}_o + \vec{B}_m = \mu_0 (\vec{H} + \vec{M})$	<p>definition &amp; explanation of the terms involved:- The magnetic induction (total magnetic field) inside the specimen B is equal to the sum of the magnetic field <math>B_o</math> produced in vacuum due to the magnetising field and the magnetic field <math>B_m</math> due to the induced magnetism of the substance.</p>	<p>tesla</p>
<p><b>MAGNETIC SUSCEPTIBILITY</b></p> $\chi_m = \frac{ \vec{M} }{ \vec{H} }$	<p><math>X_M</math>=magnetic susceptibility M= intensity of magnetization H=magnetising field</p>	<p><math>X_m</math>= no unit M = <math>\text{Am}^{-1}</math> H = <math>\text{Am}^{-1}</math></p>

<p><b>CURIE'S LAW</b></p> $\chi_m \propto \frac{1}{T} \text{ or } \chi_m = \frac{C}{T}$	<p>C = Curie constant T=temperature <math>X_M</math>=magnetic susceptibility</p>	<p><math>X_m</math>= no unit</p>
<p><b>CURIE-WEISS LAW</b></p> $\chi_m = \frac{C}{T - T_C}$	<p><math>X_M</math>=magnetic susceptibility C = Curie constant <math>T_C</math>= Curie temperature T=temperature</p>	<p><math>X_m</math>= no unit</p>
<p><b>BIOT-SAVART LAW</b></p> $d\vec{B} = \frac{\mu_0}{4\pi} \frac{Id\vec{l} \times \hat{r}}{r^2}$ $\Rightarrow d\vec{B} = \frac{\mu_0}{4\pi} \frac{Idl \sin \theta}{r^2} \hat{n}$	<p>r=distance between the point P and dl dl =magnitude of the length element I=current; B=magnetic field</p>	<p>Magnetic field B = Tesla (T)</p>
<p><b>MAGNETIC FIELD DUE TO LONG STRAIGHT CONDUCTOR CARRYING CURRENT</b></p> $\vec{B} = \frac{\mu_0 I}{2\pi a} \hat{n}$	<p><math>\mu_0</math>= absolute permeability of free space B=magnetic field</p>  <p>I=current; a=dist. b/w straight conductor &amp; the chosen point 'P'</p>	<p>Magnetic field B = Tesla (T)</p>
<p><b>NOTES:-</b></p>		

<p><b>MAGNETIC FIELD PRODUCED ALONG THE AXIS OF THE CURRENT-CARRYING CIRCULAR COIL</b></p> $\vec{B} = \frac{\mu_0 I}{2} \frac{R^2}{(R^2 + z^2)^{3/2}} \hat{k}$ <p>(i) If the circular coil contains <math>N</math> turns, then the magnetic field is</p> $\vec{B} = \frac{\mu_0 NI}{2} \frac{R^2}{(R^2 + z^2)^{3/2}} \hat{k}$ <p>(ii) The magnetic field at the centre of the coil is</p> $\vec{B} = \frac{\mu_0 NI}{2R} \hat{k} \quad \text{since } z = 0$	<p><math>\mu_0</math> = absolute permeability of free space  <math>B</math> = magnetic field  <math>i</math> = current  <math>r</math> and <math>z</math> = refer from diagram</p> 	<p>Magnetic field <math>B =</math> Tesla (T)</p>
<p><b>TANGENT LAW</b></p> $B_H = \frac{\mu_0 N}{2R} \frac{I}{\tan \theta}$	<p><math>N</math> = no of turns  <math>R</math> = radius of the coil  <math>I</math> = current  <math>\tan \theta</math> = angle of deflection produced</p>	<p>Magnetic field <math>B =</math> Tesla (T)</p>
<p><b>MAGNETIC DIPOLE MOMENT IN CURRENT LOOP AS A MAGNETIC DIPOLE</b></p> $\vec{p}_m = I \vec{A}$	<p><math>pm</math> = magnetic dipole moment  <math>A</math> = area of the circular loop <math>A = \pi r^2</math>  <math>I</math> = current</p>	<p>Ampere per metre square  <math>\text{Am}^2</math></p>
<p><b>MAGNETIC DIPOLE MOMENT OF REVOLVING ELECTRON</b></p> $\mu_L = n \times 9.27 \times 10^{-24} \text{ Am}^2$	<p><math>\mu_L</math> = Magnetic dipole moment  <math>n</math> = principal quantum no. (no of the orbit)</p>	<p><math>\text{Am}^2</math></p>
<p><b>AMPÈRE'S CIRCUITAL LAW</b></p> $\oint_C \vec{B} \cdot d\vec{l} = \mu_0 I_{\text{enclosed}}$	<p><math>B</math> = magnetic field  <math>\mu_0</math> = absolute permeability of free space  <math>d\vec{l}</math> = closed loop  <math>I</math> = current in enclosed area</p>	<p><math>N/A^2 = NA^{-2}</math></p>

<p><b>MAGNETIC FIELD DUE TO THE CURRENT CARRYING WIRE OF INFINITE LENGTH USING AMPÈRE'S LAW</b></p> $\vec{B} = \frac{\mu_0 I}{2\pi r} \hat{n}$	<p>B=magnetic field  <math>\mu_0</math>= absolute permeability of free space            I=current            r= Radius of the Ampèrian loop</p>	<p>Magnetic field B = Tesla (T)</p>
<p><b>MAGNETIC FIELD DUE TO A LONG CURRENT CARRYING SOLENOID</b></p> $B = \mu_0 \frac{nLI}{L} = \mu_0 nI$	<p>n=no of turns per unit length=N/L            L=length of the solenoid            I=current</p>  <p>The diagram shows a solenoid with current flowing into the page (indicated by 'x' symbols). Blue lines represent the magnetic field lines, which are uniform and parallel inside the solenoid. A red rectangular Amperian loop is drawn around the solenoid, with points a, b, c, and d. The length of the loop inside the solenoid is labeled 'h'. A legend indicates that a square with a dot represents current coming out of the page, and a square with an 'x' represents current going into the page.</p>	<p>Magnetic field B = Tesla (T)</p>
<p><b>MAGNETIC FIELD - TOROID</b>  <b>1.INSIDE THE TOROID</b></p> $B_s = \mu_0 nI$ <p><b>2.OPEN SPACE INTERIOR TO THE TOROID</b></p> $\vec{B}_p = 0$ <p><b>3.OPEN SPACE EXTERIOR TO THE TOROID</b></p> $\vec{B}_o = 0$	<p><math>\mu_0</math>= absolute permeability of free space</p> $n = \frac{N}{2\pi r_2}$ <p>n=no of turns per unit length            N=total no of turns in the toroid</p>  <p>The diagram shows a toroid with current flowing into the page (indicated by 'x' symbols). Red lines represent the magnetic field lines, which are circular and concentrated inside the toroid. A red Amperian loop is drawn inside the toroid, with radius 'r' and length '2πr'. A legend indicates that a square with a dot represents current coming out of the page, and a square with an 'x' represents current going into the page.</p>	<p>Magnetic field B = Tesla (T)</p>
<p><b>LORENTZ FORCE</b></p> $\vec{F} = q(\vec{v} \times \vec{B})$ $F_m = qvB \sin \theta$	<p>F=Lorentz force            q=charge            v=velocity of the charge in the magnetic field B            B= magnetic field</p>	<p>Newton</p>
<p><b>TESLA</b></p> $1 \text{ T} = \frac{1 \text{ N s}}{\text{C m}} = 1 \frac{\text{N}}{\text{A m}} = 1 \text{ N A}^{-1} \text{ m}^{-1}$	<p>The strength of the magnetic field is one tesla if a unit charge moving normal to the magnetic field with unit velocity experiences unit force.</p>	<p><math>\text{NA}^{-1}\text{m}^{-1}</math></p>

<p><b>MOTION OF A CHARGED PARTICLE IN A UNIFORM MAGNETIC FIELD</b></p> <p><b>TIME PERIOD:</b></p> $T = \frac{2\pi m}{qB}$ <p><b>ANGULAR FREQUENCY</b></p> $\omega = 2\pi f = \frac{q}{m} B$	<p>m=mass q=charge B=Magnetic field T=Time period f=frequency w=angular frequency</p> <p><b>FREQUENCY:</b></p> $f = \frac{qB}{2\pi m}$	 <p>time: seconds (s) frequency: hertz(Hz) Angular frequency radian per seconds(rad s<sup>-1</sup>)</p>
<p><b>MOTION OF A CHARGED PARTICLE UNDER CROSSED ELECTRIC AND MAGNETIC FIELD (VELOCITY SELECTOR)</b></p> $v_o = \frac{E}{B}$	<p>v=velocity E=electric field B=magnetic field</p>	 <p>ms<sup>-1</sup></p>
<p><b>CYCLOTRON</b></p> $f_{osc} = \frac{qB}{2\pi m}$ $T = \frac{2\pi m}{qB}$ $KE = \frac{1}{2}mv^2 = \frac{q^2 B^2 r^2}{2m}$	<p>f=frequency T=Time period KE=kinetic energy q=charge B=magnetic field m=mass r=radius</p>	 <p>time: seconds (s) frequency: hertz(Hz) KE= joule(J)</p>
<p><b>FORCE ON A CURRENT CARRYING CONDUCTOR PLACED IN A MAGNETIC FIELD</b></p> $\vec{F}_{total} = (I\vec{l} \times \vec{B})$ <p>In magnitude,</p> $F_{total} = BIl \sin \theta$	<p>I=current l=length of straight current carrying conductor B=magnetic field</p>	 <p>Newton (N)</p>

### FORCE BETWEEN TWO LONG PARALLEL CURRENT CARRYING CONDUCTORS

#### FORCE ON CONDUCTOR A

$$\frac{\vec{F}}{l} = -\frac{\mu_0 I_1 I_2}{2\pi r} \hat{j}$$

#### FORCE ON CONDUCTOR B

$$\frac{\vec{F}}{l} = \frac{\mu_0 I_1 I_2}{2\pi r} \hat{j}$$

$I_1$  and  $I_2$  = electric currents passing through the conductors A and B in same direction  
 $r$  = conductors separated by a distance  $r$   
 $\mu_0$  = absolute permeability of free space

force =  
newton(N)

### TORQUE ON A CURRENT LOOP PLACED IN A MAGNETIC FIELD

$$\tau = NIAB \sin \theta$$

(a) When  $\theta = 90^\circ$  or the plane of the loop is parallel to  $B$ ,  $\tau$  is maximum.

$$\tau_{\max} = IAB$$

(b) When  $\theta = 0^\circ/180^\circ$  or the plane of the loop is perpendicular to  $B$ , the  $\tau$  is 0.

$N$  = no of turns  
 $I$  = Current flowing in the loop  
 $A$  = Area  
 $B$  = magnetic field

torque:  
newton  
metre  
Nm

### CURRENT IN A MOVING COIL GALVANOMETER

$$I = G \theta$$

$I$  = Current

$G$  = galvanometer constant

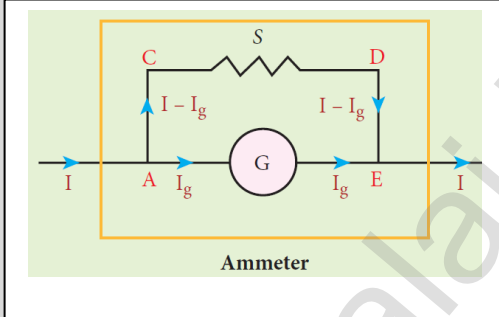

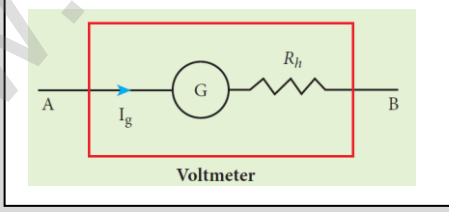

$\vartheta$  = amount of twist

$$G = \frac{K}{NAB}$$

Current =  
Ampere  
(A)

<p><b>VOLTAGE SENSITIVITY</b></p> $V_s = \frac{\theta}{V}$ $V_s = \frac{\theta}{IR_g} = \frac{NAB}{KR_g}$ $V_s = \frac{1}{GR_g} = \frac{I_s}{R_g}$	<p>The deflection produced per unit voltage applied across galvanometer.</p>	<p>rad V<sup>-1</sup></p>
<p><b>GALVANOMETER TO AN AMMETER</b></p> $I_g = \frac{S}{S + R_g} I$	<p>R<sub>a</sub>=resistance of ammeter R<sub>g</sub>=galvanometer's resistance S=shunt resistance through the path</p> 	<p>-----</p>
<p>In order to increase the range of an ammeter <math>n</math> times, the value of shunt resistance to be connected in parallel is</p> $S = \frac{R_g}{n-1}$		
<p><b>GALVANOMETER TO A VOLTMETER</b></p> $I_g = \frac{V}{R_g + R_h}$ $\Rightarrow R_h = \frac{V}{I_g} - R_g$	<p>R<sub>H</sub>=Resistance value connected in series with the galvanometer I<sub>G</sub>=Current(galvanometer) R<sub>g</sub>=galvanometer's resistance</p> 	<p>-----</p>
<p>In order to increase the range of voltmeter <math>n</math> times the value of resistance to be connected in series with galvanometer is</p> $R_h = (n-1) R_g$
