FORMULAE	EXPLANATION OF THE TERMS INVOLVED	SI UNIT
<p><b>MAGNETIC FLUX</b></p> $\Phi_B = \int_A \vec{B} \cdot d\vec{A}$ $\Phi_B = \int_A \vec{B} \cdot d\vec{A} = BA \cos\theta$	<p>Magnetic Flux = (<math>\phi</math>)            A = area where the integral is taken over  <math>\theta</math> = angle b/w the direction of the magnetic field and the outward normal to the area            B = magnetic field</p>	<p><b>SI unit: Tm<sup>2</sup>.</b></p> <p><b>other unit: weber or Wb</b>  <b>1 Wb = 1 T m<sup>2</sup></b></p>
<p><b>FARADAY'S II-ND LAW OF ELECTROMAGNETIC INDUCTION</b></p> $\epsilon = \frac{d(N\phi)}{dt}$	<p><math>\epsilon</math> = induced emf  <math>\phi</math> = magnetic flux            N = no of turns in the coil            N<math>\phi</math> = flux linkage</p>	<p><b>VOLT</b></p>
<p><b>LENZ'S LAW</b></p> $\epsilon = - \frac{d(N\phi)}{dt}$	<p><math>\epsilon</math> = induced emf  <math>\phi</math> = magnetic flux            N = no of turns in the coil            N<math>\phi</math> = flux linkage  <b>Negative sign denotes that direction of induced emf opposes the change in magnetic flux.</b></p>	<p><b>VOLT</b></p>
<p><b>MOTIONAL EMF FROM LORENTZ FORCE</b></p> $\epsilon = Blv$ <p>If the ends A and B are connected by an external circuit of total resistance R, then current <math>i = \frac{\epsilon}{R} = \frac{Blv}{R}</math></p>	<p><math>\epsilon</math> = emf            B = uniform magnetic field            l = length of the rod            v = uniform velocity of the rod in magnetic field</p> 	<p><b>VOLT</b></p>

**ROD ROTATING** about one of its ends with angular velocity in a uniform magnetic field where the plane of rotation of rod is perpendicular to the field

$$\varepsilon = \frac{1}{2} B \omega l^2$$

$B$  = uniform magnetic field

$l$  = length of the rod

$\omega$  = angular velocity

**VOLT**

### SELF-INDUCTION

$$L = \frac{N\Phi_B}{i}$$

**cases:**

- If  $i = 1A$ , then  $L = N\Phi_B$

$L$  = self-inductance or coefficient of self-induction of the coil

$N\phi$  = flux linkage

$i$  = current in the coil

- If current  $i$  changes with time, an emf is induced in it.

$$\varepsilon = -L \frac{di}{dt} \Rightarrow L = \frac{-\varepsilon}{di/dt}$$

- $Wb A^{-1}$
- $Vs A^{-1}$
- **henry (H)**

$$1H = 1Wb A^{-1} = 1Vs A^{-1}$$

### SELF-INDUCTANCE OF A LONG SOLENOID

$$L = \mu n^2 Al$$

$$\rightarrow L = \mu_0 \mu_r n^2 Al$$

$A$  = cross sectional area of the coil

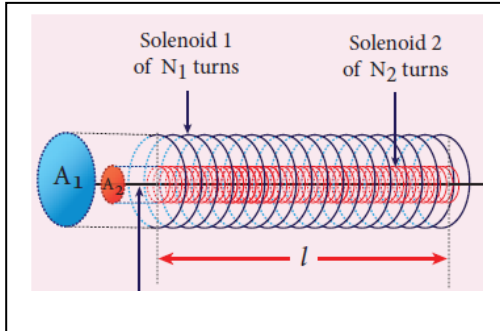

$\mu_0$  = permeability of free space

$\mu_r$  = dielectric medium's relative permeability

$n$  = turn density  $\Rightarrow n = \frac{N}{l}$

**Henry (H)**

<p><b>ENERGY STORED IN AN INDUCTOR</b></p> $W = U_B = \frac{1}{2} Li^2$	<p><math>W = U_B =</math> Energy stored in an inductor  <math>L =</math> Self-inductance of a long solenoid  <math>i =</math> alternating current</p>	<p><b>Joule (J)</b></p>
<p><b>ENERGY DENSITY</b></p> $u_B = \frac{B^2}{2\mu}$	<p><math>u_B =</math> energy density  <math>B =</math> magnetic field of long solenoid = <math>\mu_0 ni</math></p>	<p><b>JOULE / m<sup>3</sup></b></p>
<p><b>MUTUAL INDUCTION</b></p> $M_{21} = \frac{N_2 \Phi_{21}}{i_1}; M_{21} = \frac{-\epsilon_2}{di_1/dt}$ $M_{12} = \frac{N_1 \Phi_{12}}{i_2}; M_{12} = \frac{-\epsilon_1}{di_2/dt}$	<p><math>i_1 =</math> current in coil 1  <math>i_2 =</math> current in coil 2  <math>M_{12} =</math> mutual induction on coil 1 due to coil 2  <math>M_{21} =</math> mutual induction on coil 2 due to coil 1</p>	<p><b>Henry (H)</b></p>
<p><b>MUTUAL INDUCTANCE BETWEEN TWO LONG CO-AXIAL SOLENOIDS</b></p> $M = \mu_0 n_1 n_2 A_2 l$ <p>If a dielectric medium of relative permeability <math>\mu_r</math> is present inside the solenoids,</p> $M = \mu n_1 n_2 A_2 l \text{ (or)}$ $M = \mu_0 \mu_r n_1 n_2 A_2 l$	<p><math>l =</math> length of the solenoid  <math>A_2 =</math> Cross sectional area of the solenoid 2  <b>A1&gt;A2</b>  <math>n =</math> turn density <math>\Rightarrow n = \frac{N}{l}</math>  <math>\mu_0 =</math> permeability of free space  <math>\mu_r =</math> dielectric medium's relative permeability</p> 	<p><b>Henry (H)</b></p>

<p><b>ENERGY CONSERVATION</b></p> $P = \frac{B^2 l^2 v^2}{R}$	<p>P = power  V = uniform velocity of the rod in the B field  B = magnetic field  l = length of the rod  R = Resistance</p>	<p><b>Watt or joule / s</b></p>
<p><b>ALTERNATING CURRENT</b></p> $i = I_m \sin \omega t$	<p>i = alternating current  <math>I_m</math> = maximum value of induced current  <math>\omega t</math> = phase difference</p>	
<p><b>ALTERNATING EMF</b></p> $\varepsilon = \varepsilon_m \sin \omega t$	<p><math>\varepsilon_m</math> = maximum value of induced emf  <math>\varepsilon</math> = sinusoidal emf or alternating emf  <math>\omega t</math> = phase difference</p>	<p><b>VOLT</b></p>
<p><b>TRANSFORMER (voltage transformation ratio)</b></p> $\frac{V_s}{V_p} = \frac{N_s}{N_p} = \frac{I_p}{I_s} = K$	<p><math>N_p</math> and <math>N_s</math> = number of turns in the primary and secondary coil respectively  <math>i_p</math> and <math>i_s</math> = currents in the primary and secondary coil respectively  <math>v_s</math> and <math>V_p</math> = is the voltage across primary and secondary coil respectively</p>	<p>-----</p>
<p><b>STEP-UP TRANSFORMER</b></p> $N_s > N_p (K > 1), \text{ then } V_s > V_p$ $I_s < I_p$	<p>voltage is increased and the current is decreased</p>	<p>-----</p>
<p><b>STEP-DOWN TRANSFORMER</b></p> $N_s < N_p (K < 1), \text{ then } V_s < V_p$ $I_s > I_p$	<p>voltage is decreased and the current is increased</p>	<p>-----</p>

<p><b>EFFICIENCY OF A TRANSFORMER</b></p> $\eta = \frac{\text{Output power}}{\text{Input power}} \times 100\%$	<p>The efficiency <math>\eta</math> of a transformer is defined as the ratio of the useful output power to the input power</p>	<p><b>% (percentage)</b></p>
<p><b>MEAN OR AVERAGE VALUE OF AC (alternating current)</b></p> $I_{av} = \frac{\text{Area of positive half-cycle (or negative half-cycle)}}{\text{Base length of half-cycle}}$ <p>→ <math>I_{av} = 0.637 I_m</math></p>	<p><math>I_{av}</math> = Mean or Average value of AC  <math>I_m</math> = maximum value current            Base length of half-cycle = <math>\pi</math></p> <p>If there are <math>n</math> currents in a half-cycle of AC, namely <math>i_1, i_2, \dots, i_n</math>, then average value is given by</p> $I_{av} = \frac{\text{Sum of all currents over half-cycle}}{\text{Number of currents}}$ $I_{av} = \frac{i_1 + i_2 + \dots + i_n}{n}$	<p><b>AMPERE</b></p>
<p><b>RMS VALUE OF AC</b></p> $I_{RMS} = \sqrt{\frac{\text{Area of one cycle of squared wave}}{\text{Base length of one cycle}}}$ <p>⇒ <math>I_{RMS} = 0.707 I_m</math></p> <p>Similarly for alternating voltage,  <math>V_{RMS} = 0.707 V_m</math>.</p> <p>NOTE: <math>V_m = \sqrt{2} V_{rms}</math></p>	<p><math>I_{RMS}</math> = RMS value of AC            Base length of one cycle = <math>2\pi</math>            For a symmetrical sinusoidal current rms value of current is 70.7 % of its peak value.</p> <p>For example, if we consider <math>n</math> currents in one cycle of AC, namely <math>i_1, i_2, \dots, i_n</math>, then RMS value is given by</p> $I_{RMS} = \sqrt{\frac{\text{Sum of squares of all currents over one cycle}}{\text{Number of currents}}}$ $I_{RMS} = \sqrt{\frac{i_1^2 + i_2^2 + \dots + i_n^2}{n}}$	<p><b><math>I_{RMS}</math> = AMPERE</b></p> <p><b><math>V_{RMS}</math> = VOLTS</b></p>

<p><b>AC CIRCUIT CONTAINING PURE RESISTOR</b></p> <p><math>i = I_m \sin \omega t</math></p>	<p>Applied voltage and the current are in phase with each other in a resistive circuit</p>	<p><b>I=AMPERE</b></p>
<p><b>AC CIRCUIT CONTAINING ONLY AN INDUCTOR</b></p> <p><math>i = I_m \sin\left(\omega t - \frac{\pi}{2}\right)</math></p>	<p>current lags behind the applied voltage by <math>\frac{\pi}{2}</math> in an inductive circuit</p>	<p><b>I=AMPERE</b></p>
<p><b>INDUCTIVE REACTANCE</b></p> <p><math>X_L = \omega L</math></p>	<p><math>X_L</math> = inductive reactance  <math>\omega L</math> = resistance offered by the inductor            The inductive reactance (<math>X_L</math>) varies directly as the frequency. <math>\rightarrow X_L = 2\pi f L</math></p>	<p><b>ohm</b></p>
<p><b>AC CIRCUIT CONTAINING ONLY A CAPACITOR</b></p> <p><math>i = I_m \sin\left(\omega t + \frac{\pi}{2}\right)</math></p>	<p>current leads the applied voltage by <math>\frac{\pi}{2}</math> in a capacitive circuit</p>	<p><b>I = AMPERE</b></p>
<p><b>CAPACITIVE REACTANCE</b></p> <p><math>X_c = \frac{1}{\omega C}</math></p> <p><math>\rightarrow XC \propto \frac{1}{f}</math></p>	<p>Capacitive reactance = <math>XC</math>  <math>\frac{1}{\omega C}</math> = resistance offered by the capacitor</p> <p><math>X_c = \frac{1}{\omega C} = \frac{1}{2\pi f C} = \frac{1}{0} = \infty</math></p> <p>capacitive circuit offers infinite resistance to the steady current.</p>	<p><b>ohm</b></p>
<p><b>©PRIT-EDUCATION 2024-2025</b></p>		

<p><b>SERIES RLC CIRCUIT</b></p> $I_m = \frac{V_m}{Z}$ <p>Where, <math>Z = \sqrt{R^2 + (X_L - X_C)^2}</math></p> <p><b>SPECIAL CASES</b></p> <p>1) If <math>X_L &gt; X_C</math>, <math>(X_L - X_C)</math> is positive  <math>\therefore i = I_m \sin \omega t</math>; <math>v = V_m \sin(\omega t + \phi)</math></p>	<p>Capacitive reactance = <math>X_C</math>  <math>X_L</math> = inductive reactance  <math>I_m</math> = maximum value current  <math>V_m</math> = maximum voltage  <math>Z</math> = impedance of the circuit (effective opposition to the current by the series RLC circuit)</p> <p>2) If <math>X_L &lt; X_C</math>, <math>(X_L - X_C)</math> is negative  <math>\therefore i = I_m \sin \omega t</math>; <math>v = V_m \sin(\omega t - \phi)</math></p> <p>3) If <math>X_L = X_C</math>, <math>\phi</math> is zero  <math>\therefore v = V_m \sin \omega t</math>; <math>i = I_m \sin \omega t</math></p>	-----
<p><b>RESONANCE IN SERIES RLC CIRCUIT</b></p> $\omega_r = \frac{1}{\sqrt{LC}}$	<p><math>\omega_r</math> = frequency of the applied alternating source</p> <p><math>\frac{1}{\sqrt{LC}}</math> = natural frequency of the RLC circuit</p>	<b>HERTZ</b>
<p><b>QUALITY FACTOR/Q-FACTOR</b></p> $Q\text{-factor} = \frac{1}{R} \sqrt{\frac{L}{C}}$	<p>Q-factor = <math>\frac{\text{Voltage across L or C at resonance}}{\text{Applied voltage}}</math></p> <p>R = Resistance connected in the circuit  L = Inductance  C = capacitance</p>	

©PRIT-EDUCATION 2024-2025

**POWER IN AC CIRCUITS**

$$P_{av} = V_{RMS} I_{RMS} \cos \phi$$

**SPECIAL CASES**

(i) For a purely resistive circuit, the phase angle between voltage and current is zero and  $\cos \phi = 1$ .

$$P_{av} = V_{RMS} I_{RMS}$$

(iv) For series RLC circuit at resonance, the phase angle is zero and  $\cos \phi = 1$

$$P_{av} = V_{RMS} I_{RMS}$$

$$V_{RMS} I_{RMS} = \text{apparent power}$$

$$\cos \phi = \text{power factor}$$

The average power of an AC circuit is also known as the true power of the circuit

(ii) For a purely inductive or capacitive circuit, the phase angle is  $\pm \frac{\pi}{2}$  and  $\cos(\pm \frac{\pi}{2}) = 0$ .

$$\therefore P_{av} = 0$$

(iii) For series RLC circuit, the phase angle

$$\phi = \tan^{-1} \left( \frac{X_L - X_C}{R} \right)$$

$$\therefore P_{av} = V_{RMS} I_{RMS} \cos \phi$$

**WATTS****POWER FACTOR**

(i) Power factor =  $\cos \phi = \text{cosine of the angle of lead or lag}$

(ii) Power factor =  $\frac{R}{Z} = \frac{\text{Resistance}}{\text{Impedance}}$

(iii) Power factor =  $\frac{P_{av}}{V_{RMS} I_{RMS}}$   
 $= \frac{\text{True power}}{\text{Apparent power}}$

**WATTS**

**Table 4.3 Analogies between electrical and mechanical quantities**

Electrical system	Mechanical system
Charge $q$	Displacement $x$
Current $i = \frac{dq}{dt}$	Velocity $v = \frac{dx}{dt}$
Inductance $L$	Mass $m$
Reciprocal of capacitance $\frac{1}{C}$	Force constant $k$

Electrical energy $= \frac{1}{2} \left( \frac{1}{C} \right) q^2$	Potential energy $= \frac{1}{2} k x^2$
Magnetic energy $= \frac{1}{2} L i^2$	Kinetic energy $= \frac{1}{2} m v^2$
Electromagnetic energy $U = \frac{1}{2} \left( \frac{1}{C} \right) q^2 + \frac{1}{2} L i^2$	Mechanical energy $E = \frac{1}{2} k x^2 + \frac{1}{2} m v^2$
