

ISLAMIAH MAT HR SEC SCHOOL, KILAKARAI, RAMANATHAPURAM DT.

XI COMMON PUBLIC EXAMINATION, MARCH -2025 (17-03-2025)

TENTATIVE ANSWER KEY
Question type A

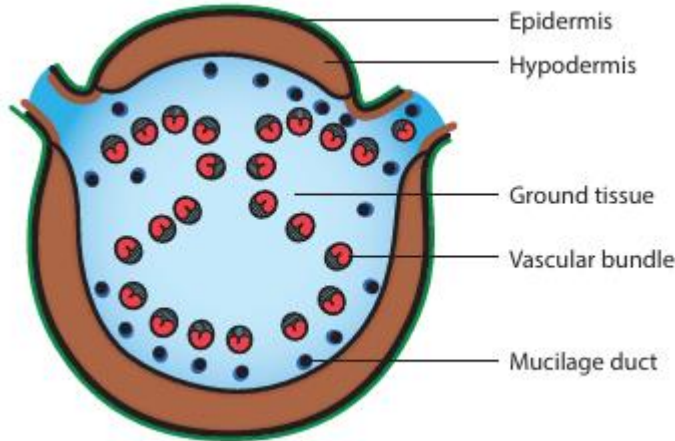

SUB: BOTANY

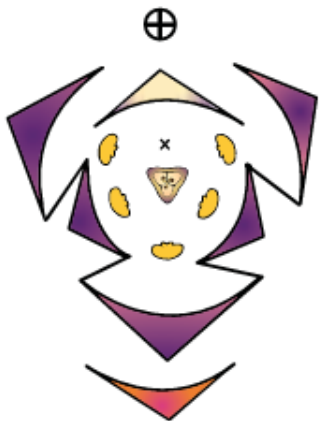

MARKS: 70

Q.NO	CONTENT	MARKS	MODE OF QUESTION
PART -I			
I.	CHOOSE THE CORRECT ANSWER	15 X 1 =15	BOOK BACK / BOOK INSIDE/ CREATIVE
1	(d) (i) is not correct but (ii) and (iii) are correct	1	BOOK INSIDE
2	(a) Carry out photosynthetic reations	1	BOOK INSIDE
3	(d) before fertilization	1	BOOK BACK
4	(b) Artificial system of classification	1	BOOK INSIDE
5	(d) All the above	1	BOOK BACK
6	(b) (1)-(iii), (2)-(ii), (3)-(i), (4)-(iv)	1	BOOK INSIDE
7	(d) DPD= 0 atm; OP=20 atm; TP=10 atm;	1	BOOK BACK
8	(a) two homologous Chromosomes	1	BOOK BACK
9	(c) β -(1,4) glycosidic Linkage	1	BOOK INSIDE
10	(a) 6	1	BOOK BACK
11	(a) (1)-(iv), (2)-(iii), (3)-(i), (4)-(ii)	1	BOOK BACK
12	(b) lack of motile structure	1	BOOK BACK
13	(d) Collenchyma	1	BOOK INSIDE
14	(a) Chi-c	1	BOOK BACK
15	(b) Only ovary of the flower develops into fruit	1	BOOK BACK

Q.NO	CONTENT	MARKS	MODE OF QUESTION																																	
II.	PART -II ANSWER ANY SIX OF THE FOLLOWING QUESTION NUMBER 24 IS COMPULSORY	6 X 2 = 12	BOOK BACK / BOOK INSIDE/ CREATIVE																																	
16	Types of mycelia found in Agaricus Three types of mycelia are seen namely primary mycelium, secondary mycelium and tertiary mycelium.	2	BOOK BACK																																	
17	Pycnoxylic compact with narrow medullary ray-Pinus	2	BOOK BACK																																	
18	Phylloclades Stem becomes modified into flattened, leaf like and becomes succulent in several species of Euphorbia. Such modified stem is called phylloclades eg ANY ONE Opuntia, Phyllocactus, Muehlenbeckia (flattened phylloclade) Casuarina, Euphorbia tirucalli, Euphorbia antiquorum (cylindrical phylloclade).	2	BOOK INSIDE																																	
19	Difference between plant and animal cells <table><tr><th>S. No</th><th>Plant cell</th><th>Animal Cell</th></tr><tr><td>1</td><td>Usually they are larger than animal cells</td><td>Usually smaller than plant cells</td></tr><tr><td>2</td><td>Cell wall present in addition to plasma membrane and consists of middle lamellae, primary and secondary walls</td><td>Cell wall absent</td></tr><tr><td>3</td><td>Plasmodesmata present</td><td>Plasmodesmata absent</td></tr><tr><td>4</td><td>Chloroplast present</td><td>Chloroplast absent</td></tr><tr><td>5</td><td>Vacuole large and permanent</td><td>Vacuole small and temporary</td></tr><tr><td>6</td><td>Tonoplast present around vacuole</td><td>Tonoplast absent</td></tr><tr><td>7</td><td>Centrioles absent except motile cells of lower plants</td><td>Centrioles present</td></tr><tr><td>8</td><td>Nucleus present along the periphery of the cell</td><td>Nucleus at the centre of the cell</td></tr><tr><td>9</td><td>Lysosomes are rare</td><td>Lysosomes present</td></tr><tr><td>10</td><td>Storage material is starch grains</td><td>Storage material is a glycogen granules</td></tr></table>	S. No	Plant cell	Animal Cell	1	Usually they are larger than animal cells	Usually smaller than plant cells	2	Cell wall present in addition to plasma membrane and consists of middle lamellae, primary and secondary walls	Cell wall absent	3	Plasmodesmata present	Plasmodesmata absent	4	Chloroplast present	Chloroplast absent	5	Vacuole large and permanent	Vacuole small and temporary	6	Tonoplast present around vacuole	Tonoplast absent	7	Centrioles absent except motile cells of lower plants	Centrioles present	8	Nucleus present along the periphery of the cell	Nucleus at the centre of the cell	9	Lysosomes are rare	Lysosomes present	10	Storage material is starch grains	Storage material is a glycogen granules	2	BOOK BACK
S. No	Plant cell	Animal Cell																																		
1	Usually they are larger than animal cells	Usually smaller than plant cells																																		
2	Cell wall present in addition to plasma membrane and consists of middle lamellae, primary and secondary walls	Cell wall absent																																		
3	Plasmodesmata present	Plasmodesmata absent																																		
4	Chloroplast present	Chloroplast absent																																		
5	Vacuole large and permanent	Vacuole small and temporary																																		
6	Tonoplast present around vacuole	Tonoplast absent																																		
7	Centrioles absent except motile cells of lower plants	Centrioles present																																		
8	Nucleus present along the periphery of the cell	Nucleus at the centre of the cell																																		
9	Lysosomes are rare	Lysosomes present																																		
10	Storage material is starch grains	Storage material is a glycogen granules																																		
20	Significance of Mitosis Any two points 1. Genetic stability – daughter cells are genetically identical to parent cells. 2. Growth – as organisms grow, the number of cells making up their tissue increases. The new cells must be identical to the existing ones. 3. Repair of tissues - damaged cells must be replaced by identical new cells by mitosis. 4. Asexual reproduction – asexual reproduction results	2	BOOK BACK																																	

	<p>in offspring that are identical to the parent. Example Yeast and Amoeba.</p> <p>5. In flowering plants, structure such as bulbs, corms, tubers, rhizomes and runners are produced by mitotic division. When they separate from the parent, they form a new individual. The production of large numbers of offsprings in a short period of time, is possible only by mitosis. In genetic engineering and biotechnology, tissues are grown by mitosis (i.e. in tissue culture).</p> <p>6. Regeneration – Arms of star fish</p>								
21	<p>Differentiate <i>Pinus</i> wood and <i>Morus</i> wood</p> <table><tr><td>Porous wood or Hard wood, Example: <i>Morus</i></td><td>Non porous wood or Soft wood, Example: <i>Pinus</i></td></tr><tr><td>Common in angiosperms</td><td>Common in gymnosperms</td></tr><tr><td>Porous because it contains vessels</td><td>Non-porous because it does not contain vessels</td></tr></table>	Porous wood or Hard wood, Example: <i>Morus</i>	Non porous wood or Soft wood, Example: <i>Pinus</i>	Common in angiosperms	Common in gymnosperms	Porous because it contains vessels	Non-porous because it does not contain vessels	2	BOOK BACK
Porous wood or Hard wood, Example: <i>Morus</i>	Non porous wood or Soft wood, Example: <i>Pinus</i>								
Common in angiosperms	Common in gymnosperms								
Porous because it contains vessels	Non-porous because it does not contain vessels								
22	<p>Floral formula</p> <p>Br, Eb, \oplus \otimes K (5), C (5), A (5), <u>G</u> (5) .</p>	2	BOOK BACK						
23	<p>Types of RNA</p> <p>mRNA</p> <p>tRNA</p> <p>rRNA</p>	2	BOOK BACK						
24	<p>Uses of Plant Anti-transpirants</p> <ul style="list-style-type: none">• Antitranspirants reduce the enormous loss of water by transpiration in crop plants.• Useful for seedling transplantations in nurseries.	2	BOOK INSIDE

34 (b)	<p>Aestivation</p> <p>Arrangement of sepals and petals in the flower bud is said to be aestivation</p> <div></div> <p>A.Valvate B.Twisted C.Imbricate D.Quincuncial E.Vexillary</p>	5	BOOK INSIDE																																										

A. Valvate: Margins of sepals or petals do not overlap but just touch each other.
Example: Calyx in members of Malvaceae, *Calotropis*, *Annona*.

B. Twisted or convolute or contorted:
One margin of each petal or sepal overlapping on the other petal
Example: Petals of chinarose

Aestivation
Arrangement of sepals and petals in the flower bud.

D. Quincuncial: It is a type of imbricate aestivation in which two petals are external and two internal and one petal with one margin internal and the other margin external.
Example: Guava, calyx of *Ipomoea*, *Catharanthus*.

C. Imbricate: Sepals and petals irregularly overlap on each other; one member of the whorl is exterior, one interior and rest of the three having one margin exterior and the other interior.
Example: *Cassia*, *Delonix*
There are 3 types.
1. Ascendingly imbricate.
2. Quincuncial.
3. Vexillary.

E. Vexillary: Large posterior petals both margins overlap lateral petals. Lateral petals other margin overlaps anterior petals
Example: Pea, bean.

35 (a)

Economic importance of the family Euphorbiaceae
Any 5 points

5

BOOK INSIDE

Economic importance	Binomial	Useful part	Uses
Food plant	<i>Emblica officinalis</i> (Nellikai)	Fruits	Rich in vitamin C, which are edible and pickled.
	<i>P. acidus</i> (சுரைஞ்செய்யை)		
	<i>Manihot esculenta</i> (Maravalli kizhanku / Tapioca)	Tuberous roots	Roots are rich in starch and used for preparing bread, biscuits, chips and other food stuffs.
	<i>Sourropus androgynous</i>	Leaves	Greens (multi vitamin plant)
Oil plant			
Croton oil	<i>Croton tiglium</i>	Seed	Used as a powerful purgative and also to treat skin diseases.
Castor Oil	<i>Ricinus communis</i> (Amanakku/Castor)	Seeds	Used as vegetable oil, ricinoleic acid present in this oil eliminate acne causing bacteria apart from that it acts as laxative and lubricant.
Jatropha Oil	<i>Jatropha curcas</i> (Kattamanakku)	Seeds	Used for biofuels.
Rubber:			
	<i>Hevea brasiliensis</i> (Para rubber)	Coagulated latex	Latex is used in rubber products like tube and tyre.
	<i>Manihot glaziovii</i> (Manicoba rubber)		
Medicinal plants	<i>Euphorbia resinifera</i>	Latex	<i>Euphorbium</i> drug is obtained from the latex and used as a purgative.
	<i>Euphorbia hirta</i> (செய்யுதை பச்சை)	Whole plant	Lactagogue
	<i>Mallotus philippinensis</i>	Fruits	Used as anthelmintic.
	<i>Phyllanthus amarus</i> (Keezhanelli)	Entire shoot system	Used to treat jaundice.

	<table border="1"> <thead> <tr> <th>Economic importance</th><th>Binomial</th><th>Useful part</th><th>Uses</th></tr> </thead> <tbody> <tr> <td></td><td><i>Jatropha gossypifolia</i> <i>Croton tiglium</i> (தேள்வாழை) <i>Ricinus communis</i></td><td>Leaves and roots Seed Seed oil</td><td>Used in the treatment of leprosy and snakebite. 5.	Vascular bundles	(a) Collateral and open (b) Arranged in a ring (c) Secondary growth occurs	(a) Collateral and closed (b) Scattered in ground tissue (c) Secondary growth usually does not occur.																								
37 (a)	Insectivorous mode of nutrition in angiosperms Plants which are growing in nitrogen deficient areas develop insectivorous habit to resolve nitrogen deficiency. a. Nepenthes (Pitcher plant): Pitcher is a modified leaf and contains digestive enzymes. Rim of the pitcher is provided with nectar glands and acts as an attractive lid. When insect is trapped, proteolytic enzymes will digest the insect b. Drosera (Sundew): It consists of long club shaped tentacles which secrete sticky digestive fluid which looks like a sundew. c. Utricularia (Bladder wort): Submerged plant in which leaf is modified into a bladder to collect insect water. d. Dionaea (Venus fly trap): Leaf of this plant modified into a colourful trap. Two folds of lamina consist of sensitive trigger hairs and when insects touch the hairs it will close.	5	BOOK BACK

- Daily classes by **Namakkal Well Experienced Staff**
- Two years integrated program for **XI and XII - NEET**.
- We provide online test for both **NEET**.
- Weekly intensive test for **NEET**.
- We teach from basics make you achievers.
- Learn with interest without stress.
- Daily practice test and monthly cumulative test for state board.
- Extra care for slow learners.
