| 20  | <p>*The degenerated wings of kiwi is an example for organ of disuse.</p> <p>*Degeneration of wings in kiwi is due to disuse of wings over generation since they have learnt to walk on land for their needs.</p> <p>*This is an acquired characters in response to their habitat during their lifetime.</p> <p>*According to lamark's use and disuse theory. This character is passed to the off spring by inheritance.</p>  | 1<br><br>1                 |
| 21  | When trees are cut down, It gives rise to ecological problems like floods, drought, soil erosion, loss of wild life, extinction of species, imbalance of biogeochemical cycles, alteration of climatic conditions and desertification  | 2                          |
| 22  | <p><b>Find the mass percentage composition of Methane, CH<sub>4</sub></b></p> <p>molecular mass of CH<sub>4</sub> = 12 + 4<br/>= 16 g</p> <p>Mass % of carbon = <math>\frac{12}{16} \times 100</math><br/>= 75 %</p> <p>Mass % of hydrogen = <math>\frac{4}{16} \times 100</math><br/>= 25 %</p>   | 2                          |
|     | <b>PART-II</b>   |                            |
| 23. | <p><b>Ideal Gas Equation</b></p> <p>The ideal gas equation is an equation, which relates all the properties of an ideal gas. An ideal gas obeys Boyle's law and Charles's law and Avogadro's law.</p> <p>According to Boyle's law, PV = constant ..... (1)</p> <p>According to Charles's law,<br/>VT = constant ..... (2)</p> <p>According to Avogadro's law,<br/>VT = constant ..... (3)</p> <p>After combining equations (1), (2) and (3), you equation. can get the following<br/>V<sub>n</sub>T = constant ..... (4)</p> <p>The above relation is called the combined law of gases. If you consider a gas,</p> | 1<br><br>1                 |

|  | <p>which contains <math>\mu</math> moles of the gas, the number of atoms contained will be equal to <math>\mu</math> times the Avogadro number, <math>N_0</math>.</p> <p>i.e., <math>n = \mu N_A</math></p> <p>Using equation (5), in equation (4) can be written as</p> $PV\mu N_A T = \text{constant}$ <p>The value of the constant in the above equation is taken to be <math>K_B</math>, which is called as Boltzmann constant (<math>1.38 \times 10^{-23} \text{ JK}^{-1}</math>). Hence, we have the following equation:</p> $PV\mu N_A T = K_B$ $PV = \mu N_A K_B T$ $\mu N_A K_B = R$ <p>which is termed as universal gas constant whose value is <math>8.31 \text{ J mol}^{-1} \text{ K}^{-1}</math>.</p> $PV = RT$ <p>Ideal gas equation is also called as equation of state because it gives the relation between the state variables and it is used to describe the state of any gas.</p>  | 1  |  |  |  |   |   |  |  |  |                                      |   |  |   |   |  |   |                                 |   |  |

(in accordance with Fleming's left hand rule)</p> <p>Speed</p> <p>Their speed ranges from 1/10 to 1/20 times the speed of light.</p>   | <p>Deflected by both the fields; but the direction of deflection is opposite to that for alpha rays. (in accordance with Fleming's left hand rule)</p> <p>Their speed can go up to 9/10 times the speed of light.</p> | <p>penetrate through blocks.</p> <p>They are not deflected by the fields.</p> <p>They travel with light</p> |
| 26 | <p><b>Applications of Avogadro's law</b></p> <p>i. It explains Gay-Lussac's law.</p> <p>ii. It helps in the determination of atomicity of gases.</p> <p>iii. Molecular formula of gases can be derived using Avogadro's law</p> <p>iv. It determines the relation between molecular mass and vapour density.</p> <p>v. It helps to determine gram molar volume of all gases.</p>   |   | <p>Any four points<br/>4x1 = 4</p>  |
| 27 | <p><u>Alloy</u></p> <p>An alloy is a homogeneous mixture of two or more metals or of one or more metals with certain non-metallic elements.</p> <p><b>Reasons for alloying:</b></p> <ol style="list-style-type: none"> <li>To modify appearance and colour</li> <li>To modify chemical activity.</li> <li>To lower the melting point.</li> <li>To increase hardness and tensile strength.</li> <li>To increase resistance to electricity</li> </ol>  |   | <p>2</p> <p>Any two reasons</p> <p>2</p>  |
| 28 | <p><b>Cleansing action of soap</b></p> <p>A soap molecule contains two chemically distinct parts that interact differently with water. It has one <b>polar end</b>, which is a <i>short head</i> with a carboxylate group (<math>-\text{COONa}</math>) and one <b>non-polar end</b> having the <i>long tail made of the hydrocarbon chain</i>. The polar end is <i>hydrophilic (Water loving)</i> in nature and this end is attracted towards water. The non-polar end is <i>hydrophobic (Water hating)</i> in nature and it is attracted towards dirt or oil on the cloth, but not attracted towards water. When a soap or detergent is dissolved in water, the molecules join together as clusters called '<b>micelles</b>'. Their long hydrocarbon chains attach themselves to the oil and dirt. The dirt is thus surrounded by the non-polar end of the soap molecules. Thus, the dirt is washed away with the soap.</p> |   | 4   |
| 29 | <p><b>Locomotion of Leech</b></p> <p>Locomotion in leech takes place by (i) looping or crawling movement (ii) Swimming movement.</p> <p><b>(i) Looping or Crawling movement</b></p> <p>This type of movement is brought about by the contraction and relaxation of muscles. The two suckers serve for attachment during movement on a substratum.</p> <p><b>(ii) Swimming movement</b></p> <p>Leeches swim very actively and perform undulating movements in water.</p>  |   | <p>2</p> <p>2</p>   |

|            |  |   |
|------------|--|---|
| 30         |  <p><b>Structure of Neuron</b></p> <p>A neuron typically consists of three basic parts: Cyton, Dendrites and Axon.</p> <p><b>Cyton:</b> Cyton is also called cell body or perikaryon. It has a central nucleus with abundant cytoplasm called neuroplasm.</p> <p><b>Dendrites:</b> These are the numerous branched cytoplasmic processes that project from the surface of the cell body.</p> <p><b>Axon:</b> The axon is a single, elongated, slender projection.</p> | 4 |
| 31         | <p><b>(i) consequences of soil erosion</b></p> <p>The effects of soil erosion leads to loss of fertility of land, humus and nutrient. It leads to increased pollution, sedimentation in streams and rivers. Degraded lands able to hold water which can worsen flooding.</p>   | 2 |
|            | <p><b>(ii)</b> The following are the methods to prevent soil erosion:</p> <ul style="list-style-type: none"> <li>• Retain vegetation cover, so that soil is not exposed.</li> <li>• Cattle grazing should be controlled.</li> <li>• Crop rotation and soil management improve soil organic matter.</li> <li>• Runoff water should be stored in the catchment.</li> <li>• Reforestation, terracing and contour ploughing.</li> </ul>  | 2 |
| 32         | <p><b>32 Solution:</b> When the source is moving towards the stationary listener, the expression for apparent frequency is</p> $n' = \left( \frac{v}{v - v_s} \right) n$ $= \left( \frac{v}{v - \left( \frac{1}{10} \right) v} \right) n = \left( \frac{10}{9} \right) n$ $= \left( \frac{10}{9} \right) \times 90 = 100 \text{ Hz}$   | 4 |
